Ex.No : 2	JavaScript Objects and Functions
Date : 06.07.2026	

AIM :

To implement JavaScript programs using arrays and functions for managing a grocery list and tracking student grades.

2.1 Grocery List Management

Problem Statement:

Build a grocery list management system using JavaScript arrays and functions.

Given:

An array groceryList containing three items:

- "apple"
- "banana"
- "carrot"

What to do:

- Create a function addItem(item) to add a new grocery item.
- Create a function removeItem(item) to remove an existing grocery item.
- Create a function displayList() to display the current grocery list.

Proposed Solution

- **Possible JavaScript methods:**
  - Array
  - push()
  - filter()
  - Functions
  - console.log()
- **Selected method:**
  - Use **push()** to add a new item to the grocery list.
  - Use **filter()** to remove an item from the grocery list.
  - Use **console.log()** to display the updated grocery list.

Coding:

```
const groceryList = ["apple", "banana", "carrot"];

function addItem(item) {
   groceryList.push(item);
}

function removeItem(item) {
   const index = groceryList.indexOf(item);

   if (index !== -1) {
      groceryList.splice(index, 1);
   }
}

function displayList() {
   console.log("Grocery List:");
   groceryList.forEach(item => console.log(item));
}

displayList();

addItem("milk");
console.log("\nAfter Adding:");
displayList();

removeItem("banana");
console.log("\nAfter Removing:");
displayList();
```

Output:

```
PS D:\mwt\ex1> ^C
PS D:\mwt\ex1> node grocery.js
Grocery List:
apple
banana
carrot

After Adding:
Grocery List:
apple
banana
carrot
milk

After Removing:
Grocery List:
apple
carrot
milk
PS D:\mwt\ex1>
```

RESULT :

Thus, the JavaScript programs were implemented successfully, and the expected outputs were obtained.
